

User shoot once ~~AI shoot once~~

AI shoot once

The program first draws a ^{directed} board w/
coordinates A-K x-axis, & 1-9 y-axis. Then
it polls the user for random setup or manual.
Manual setup will ask for an upper left
coordinate & orientation, & then will add
that to ship location data & location map. It
will repeat for all ships without overlap.
AI ships are drawn w/ random coordinates
w/out overlap.

Then the program asks for normal or salvo
mode. Salvo is when an entire fleet fires at once,
so if chosen the user will give coordinates for each
ship's "weapons system" to target, they only get
as many shots as ships alive, same goes for AI, but
random. Normal mode gets one coordinate from
user & one from AI. Shoots on the map, &
if it is a hit it is red, if it is a miss it is
white. The game ends when one side loses all
of its ships.
